Reasons for Allowance

3. The following is an examiner's statement of reasons for allowance:

The cited prior art taken alone or in combination fail to teach the method for analyzing performance of execution of a task in a computer system including multiple threads of the task, the combination of analyzing generated trace information *by determining from the trace information at least one swap event that occurred in the protection domain during the period of time such that the software program is swapped into the protection domain so as to commence execution of the software program, retrieving for each of the determined swap events an associated value in the trace information of the issued instructions counter of the protection domain, using the retrieved associated values to calculate the value for the number of instructions executed for the software program during the period of time by the protection domain to include only increments to the issued instructions counter that occurred while the software program is swapped into the protection domain* as recited in the dependent claims 2 and 130.

The cited prior art taken alone or in combination fail to teach the method for analyzing performance of execution of a task in a computer system including multiple threads of the task, the combination of analyzing generated trace information *by creating a descriptor object for the specific group of instructions that are added to the source code of the program at the time of execution* as recited in the dependent claims 41, 42, 45, 55, 72, 73, 84, and 100.

The cited prior art taken alone or in combination fail to teach the method for analyzing performance of execution of a task in a computer system including multiple threads of the task, the combination of analyzing generated trace information by *extracting execution information corresponding to the events that occurred during the execution, using a description of specified types of events to identify groups of trace information each reflecting execution of a group of added instructions, using the identified groups and created mapping to extract current values for execution information and modifying current values of events so as to be normalized with respect to beginning of the execution* as recited in the dependent claims 49-54, and 96-99.

Therefore, the claimed invention improves the analyzing of the performance of a program and efficiency of the parallelism during the execution of a program in multithreaded architectures.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
